1 EXECUTIVE SUMMARY

1.1 Purpose

This report provides an assessment detailing the on-site survey, geo-spatial analysis and safety guidance IAW STANAG 3606,¹ Allied Range Safety Publication 4 (ARSP-4), ² and applicable United States Department of Defense (USDoD) and United States Air Force (USAF) documentation including, AFMAN 13-212,³ AFI 48-139⁴ and MIL-HBK-828C⁵ for the safe use of lasers on TAPA Range.

1.2 Conclusions

The document serves as a notification that TAPA Range has been assessed for joint NATO operations using lasers. The guidelines and recommendations outlined in this report are valid until such time that a new survey is required or the host nation establishes a Laser Safety Program and performs a range laser safety assessment. The USAF in Europe (USAFE) range manager recommends re-evaluation every three years.

2 INTRODUCTION

2.1 Background

Due to increased use of laser systems involving NATO operations, including NATO member and Partners for Peace nations, joint laser safety standards allowing range operations using lasers are required by STANAG 3606. The technical evaluation ensures all laser systems utilized on NATO ranges have been evaluated for use based upon the targets, target areas, firing positions, terrain, airspace, range boundary restrictions, and de-confliction with towers. USAFE/A3TW requested the 711 HPW/RHDO evaluate the safe use of lasers at TAPA Range IAW STANAG 3606 and ARSP-4. The Optical Radiation Safety (ORS) Team from 711 HPW/RHDO conducts range evaluations and certifications which provide range laser safety uniformly at all US Air Force Primary Training Ranges (PTR) and Major Range and Test Facility Bases (MRTFB) with current guidance as listed in Section 9 "References" of this report. The ORS Team conducts on-site surveys of NATO member nation ranges when requested.

2.2 Scope

The TAPA Range evaluation was performed on 12 September 2018. Laser targets and ground-based observation points (OPs) were verified. Targets and OPs are depicted in Attachment 2. A flight profile curve showing the minimum safe lasing altitude for fixed-wing operations was generated and is depicted in Attachment 3. Nominal Hazard Zones (NHZs) were determined for man-transportable systems, and are shown in Attachments 4-7. There is one attachment per OP. Attachments 4-7 also contain a table of targets assessed for safe use from each OP. Information listed in these attachments are to assist units training with laser systems.

2.3 Range Information

TAPA Air to Ground Range (AGR) is located within the TAPA Training Area, approximately 9 miles (14.5 km) NW of TAPA, Estonia. The range, managed by the Estonian military, has regular usage by the Estonian JTACs as well as US and other NATO forces. The range is relatively flat with sparse sandy hills 2 to 4 meters high. TAPA Range is shrubland vegetation cut out of a thick forest comprised mostly of Birch and Pine trees that provide an adequate backstop for most laser

systems. TAPA Range has one target area surrounded by four OPs: East Tower, West Tower, OP Hill, and New Tower.

3 EVALUATION PERSONNEL

a) Kurt Schuster, Physicist, JBSA Fort Sam Houston TX 78234, DSN 312-389-8074 /+1 (210) 539-8074

4 PERSONNEL CONTACTED

a) William Forkner, USAFE Training Ranges Program Manager, Ramstein AFB, Germany Comm: +94-111-480-7195, DSN:314-480-7195

5 LASER SAFETY PROGRAM

5.1 Recommendation

TAPA Range has a laser safety program. It is recommended that the TAPA Range continue to follow and stay current with the information contained in the ARSP-4. USAF personnel shall follow guidelines and procedures outlined in the ARSP-4, AFMAN 13-212, and MIL-HBK-828C.

Specific recommendations for TAPA Range include:

- a) Develop laser operator training specific to TAPA Range
- b) Develop a process to determine laser NHZs
- c) Ensure the responsibilities in Section 5.2 and 5.3 are adhered to

5.2 Host Nation

The following are considered host nation Range Authority Responsibilities IAW STANAG 3606 and ARSP-4:

- a) Obtain the laser hazard data of every laser system to be used
- b) Provide a copy of the TAPA Range Regulations and appropriate safety Standard Operating Procedures (SOPs) to the visiting nation
- c) Provide a briefing to the visiting nation prior to the laser operations, which should include at least: safety procedures, range SOPs, range opening/closing procedures, and no-fire areas and routes
- d) Confirm or provide firing points, target locations, buffer angles, and nominal hazard zones (NHZs)/probabilistic hazard zones (PHZs)
- e) Post laser warning signs as required
- f) Ensure the appropriate laser eye protection (LEP) is worn

- g) Liaise with civil authorities as required, to include setting up proper medical procedures in event of a laser injury
- h) The host nation has final approval authority for the use of lasers on its ranges by visiting nations

5.3 Visiting Nations

The following are considered visiting nation responsibilities IAW STANAG 3606 and ARSP-4:

- a) Liaise with the host nation to determine information and time line requirements for approval process. Note: As the approval process may take a significant amount of time early contact is strongly advised
- b) Ensure that the devices are properly labelled IAW country guidance
- c) Provide appropriate protective devices where required
- d) Provide laser safety information to host nations for all lasers to be used in their territory
- e) Ensure the visiting nation's regulations are adhered to in addition to the host nation's regulations when the visiting nation's regulations are more stringent than the host nation's requirements and the visiting nation's regulations require protocols and procedures which are not addressed by the host nation's regulations and SOPs
- f) If the USAF unit(s) is the visiting nation and the host nation does not have a Laser Safety Program in place, the USAF unit will comply with USAF guidance as related to training with lasers on ranges. This guidance includes, but is not limited to, DoD MIL-HDBK-828B, AFMAN 13-212 and AFI 48-139. In addition to the laser safety guidance of those documents, military training procedures in AFI 11-214⁶ and Joint Publications 3-09.1⁷ and 3-09.3⁸ will also be followed
- g) If the visiting nation is any other US Military unit, they are required to follow their service specific guidance

In the case where the host nation does not have a Laser Safety Program, it may be appropriate to use the information contained in the survey report provided by the ORS team.

6 RANGE EVALUATION

6.1 Buffer Angles

Buffer angles around laser beams are used in the range evaluation to ensure beams are properly terminated and give a margin of safe space around their footprints. Buffer angles are a method ARSP-4 introduces to ensure the beams project within the intended geometric safety analysis. The buffer angle of a laser system depends on the aiming accuracy of the system and the stability of the platform on which the laser system is mounted. The more stable the platform, the greater the pointing accuracy; the less stable the platform, the poorer the pointing accuracy. Hand-held

systems are less stable than tripod-mounted systems, and tripod-mounted systems are less stable than aircraft-mounted systems. The buffer angle increases as the stability of the system decreases. A buffer angle is typically much larger than the laser beam divergence.

Typical NATO buffer angle categories are listed in ANNEX A.4 of the ARSP-4 and fall into four groups: Fixed, Stabilized, Supported, and Unsupported. Refer to the ARSP-4 for assigned buffer angles and descriptions of each situation.

6.2 Aerial Laser Operations

6.2.1 Fixed-wing.

See Attachment 3 for approved flight profiles and laser-to-target headings for aircraft-mounted laser systems. The flight profile is restricted by the maximum forward footprint of 450 m. This flight profile curve is intended to present the worst-case scenario for all targets on TAPA Range to avoid confusion of safe altitudes for different targets. If specific targets are identified and lased, then the forward footprint used to generate the flight profile curve can be used to define the NHZ around the lased target. The buffer must be equal to or greater than the forward footprint and LEP will need to be worn if personnel are in the NHZ. Specific training scenario footprints may be verified with appropriate laser modeling software to determine if the terrain might obscure the target or pose other issues.

A 5 mrad buffer angle was used to develop the aircraft flight limitation profile curve and table in Attachment 3. Approval for firing upon any target applies for all systems with a buffer angle of 5 mrad or less. If a training scenario must deviate from this curve of safe altitudes, contact the unit laser safety officer (LSO) or the ORS team for re-evaluation. The new footprint would only apply to the specific scenario limitation.

The flight profile limitations (Attachment 3) are not mandated aircraft flight paths but rather are vertical limits at a given distance to distinguish between safe and unsafe laser use altitudes. Flight profiles for laser operations do not supersede airspace definitions and restrictions. The use of lasers outside of range-controlled airspace is not authorized by this certification.

6.3 Ground-based Laser Operations

In addition to the criteria listed in section 5.1, the following items were evaluated concerning ground-based laser operations. Line-of-Sight (LOS) was verified between each OP and its associated laser targets. The terrain and foliage were evaluated for suitability and laser firing scenarios discussed with range personnel. The firing combinations were verified to not have unusual or transient features incompatible with laser operations. The firing combinations were confirmed to avoid manned positions and methods were found to de-conflict with travel on roads or other ground maneuvers. A simulation was run on 3D geographic terrain data to predict where laser footprints would be located and determine if they would leave range boundaries.

In the traditional fixed OP approach, laser hazards are controlled by identifying the potential laser NHZs based on system buffer angle for each firing combination. These NHZs show the areas personnel must avoid and ensure the beam terminates within the range boundary. This method is used to ensure safe applications of any military laser system. It is well suited to laser systems with

long nominal ocular hazard distance (NOHD) such as IR Designators. NHZs generated for each firing combination using an appropriate buffer angle of 5, 10, and 15 mrad and are shown in Attachments 4-7. All possible firing combinations are noted in these attachments as either 'YES', 'LD', or 'NO LOS'. 'YES' indicates that the NHZ from the OP, target, and buffer angle combination will remain within the range boundary. 'LD' indicates that the NHZ could extend beyond the range boundary and the LSO needs to verify the hazard distance of the laser will not extend beyond the boundary. 'NO LOS' indicates that there is no LOS from the OP to target and is unsafe to engage. This approach requires that the Range Operating Authorities (ROA)/Range Laser Safety Officer (RLSO) ensure that all hazardous laser energy is confined within the range boundary. The ROA/RLSO must ensure safety through administrative controls (having personnel wear the proper Laser Eye Protection (LEP) if within the laser NHZ, using barricades, and closing roads, etc.).

6.4 Approved Laser Systems

Attachment 1 is a list of laser systems approved for use by USAF personnel. TAPA range also has a separate list of approved laser systems for use on TAPA range. USAF personnel are only authorized to use the lasers on Attachment 1. Contact the RHDO ORS team at 711HPW.RHDO.USAFLaserSafety@us.af.mil for laser performance data for the systems listed in Attachment 1.

6.5 Calculations and Data Sources

For detailed information on hazard footprint calculation methods and formulae, see MIL-HDBK-828C. Formulae used to generate NHZs are incorporated in the Laser Range Management Toolkit (LRMT). LRMT uses digital elevation model data from the United States Geological Survey or National Geospatial-Intelligence Agency to create the ground terrain surface and model laser NHZs. Range boundary, target, and fixed OP coordinates were obtained from range personnel and some on-site spot measurements were verified. Line of sight from the laser firing areas to the targets were verified by range personnel and documented by on-site ORS personnel.

7 RECOMMENDATIONS

7.1 General recommendations/requirements for all ranges include the following:

- a) All laser operators should meet the following minimum criteria. To fire class 3B or class 4 lasers, an individual must have received an appropriate laser range briefing by the LSO or other approved and qualified range personnel. The operator must have training and appropriate qualification in the proper and safe use of the laser systems employed. The operators must have communication capability with the range control office during laser operations. The laser operators, range control, and other personnel on the range must be able to communicate if a safety issue arises. The Range Commander must approve any alternative instructions or standard operating procedures deviating from this assessment.
- b) Warn all personnel on the range of imminent laser operations, including maintenance personnel or visitors who may be in the NHZs shown in the attachments.
- c) For laser operations, the entire NHZ shall be cleared of specular reflectors. Specular

reflectors can include, but are not limited to, glass, metal, and flat or standing water. This includes window debris scattered around the range from previous targets. Any painted object should be periodically examined for flaking or wear of the paint. All targets should be periodically checked for reflective surfaces as conditions change over time.

- d) Laser warning signs should be posted at the range main access points during laser operations. Warning signs should be written in the host countries language and in NATO Standard English. Periodic checks and replacement should be part of the Range Commander's preventive maintenance schedule.
- e) Laser operations should be immediately stopped if unauthorized personnel are observed in the NHZ, equipment malfunction is observed, target is lost in field of view, or anytime laser safety cannot be assured.
- f) Essential personnel in the NHZ should wear appropriate LEP corresponding to the wavelength and optical density for the laser used.
- g) Range personnel should document each laser mission. This documentation includes the specific type of laser activity and the start/stop times of laser operations. In addition, we recommend recording the unit using the laser, the date of laser activity, and the name of the laser used.
- h) Water can become a flat specular reflector when it is calm and clear, i.e., mirror-like surface. In these cases, the reflection hazard to personnel in towers and in other aircraft increases, requiring additional precautions. The recommendation to use a target for lasing when calm, standing water is present should be made by the RCO/LSO. The condition of the standing water will need to be taken into consideration; as a general rule if a reflected image can be seen with little distortion, it should be considered a specular reflector. No special precautions are necessary for firing during rain, fog, or snowfall. Certain ranges may need to stop laser operation if water begins pooling either on the ground or on snow.
- i) Range Commander should have emergency procedures in-place for the unlikely case of a suspected laser eye injury according to specific country and range guidance.

8 SUMMARY

TAPA Range has a laser safety program in place. It is recommended that the procedures in the TAPA Air-to-Ground Range Regulation are adhered to along with the guidelines addressed in this assessment. TAPA Range should continue to comply with STANAG 3606 and ARSP-4. Reevaluation of TAPA Range is at the discretion of USAFE Training Ranges Program Manager.

Please contact the ORS Team at DSN 389-2375/COMM (210) 539-2375, by email at 711HPW.RHDO.USAFLaserSafety@us.af.mil, or contact the individual listed in Paragraph 3 "Evaluation Personnel" if you have any questions concerning this report.

^{1.} Air Force policy is to maintain aircraft separation of 100 ft. Navy prohibits tandem or buddy aircraft lasing.

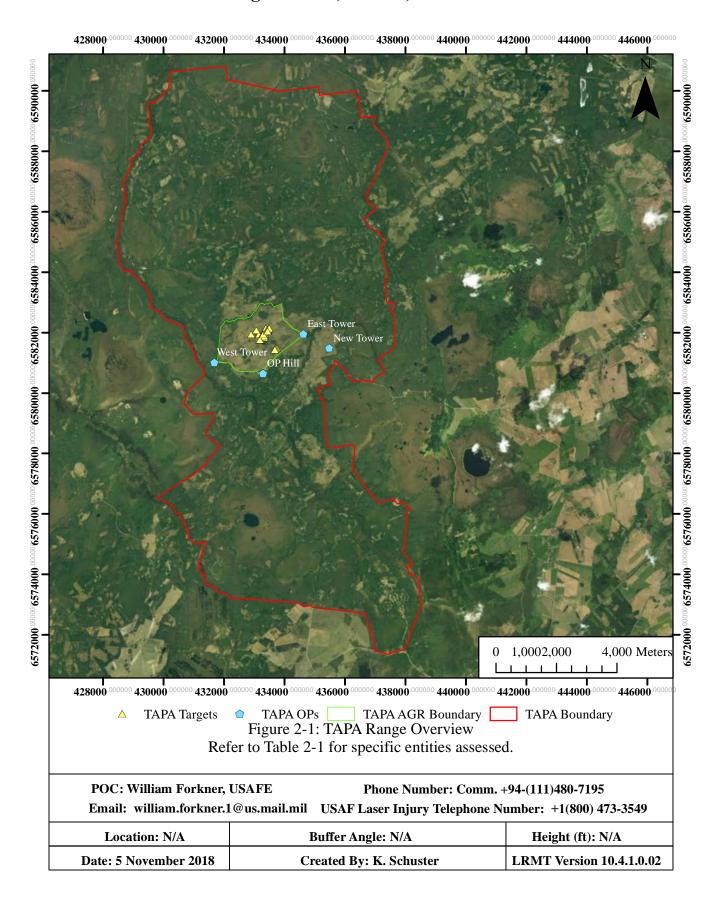

WARNING! THIS HAZARD DATA COULD CHANGE SINCE DOD HAS NO CONTROL OF MANUFACTURING OF THESE PRODUCTS. CHECK WITH THE MANUFACTURER TO ENSURE THAT CHARACTERISTICS HAVE NOT CHANGED SINCE THE LAST DOD EVALUATION.

^{2.} Air Force assigns a 2 mrad buffer zone to LANTIRN; Navy assigns a 5 mrad buffer zone

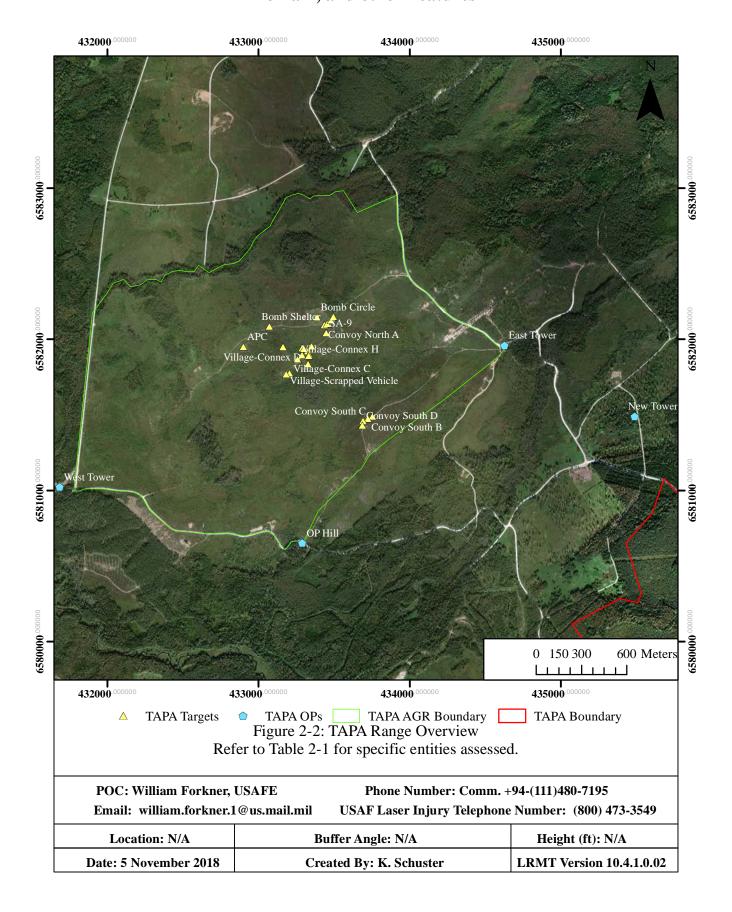

^{3.} Assume that built-in safety filter only protects against the wavelength of the laser in which it is installed, and that it does not protect against other laser wavelengths.

^{4.} Items are listed alphabetically by system.

Attachment 2. Range Maps and Imagery with Boundary, Target Locations, Ground Laser Firing Positions, Terrain, and other Features

Attachment 2. Range Maps and Imagery with Boundary, Ground Laser Firing Positions, Terrain, and other Features

Attachment 3: Flight Profile Limitations for Aircraft-Mounted Laser Systems, TAPA Range, Estonia

The calculated flight limitations profile shown is intended to minimize the laser hazard from the main beam of 5-mrad, fixed-wing laser system. By adhering to the slant-range and altitude combinations listed in Figure 3-1 and Table 3-1, the main beam from the aerial laser system will be contained within the TAPA Air to Ground (AGR) range boundaries and will not include any areas with specular reflectors or non-essential personnel.

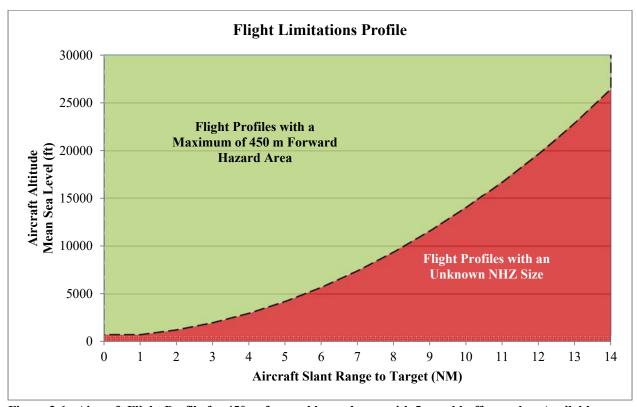

Figure 3-1. Aircraft Flight Profile for 450 m forward hazard area with 5 mrad buffer angle. Available run in headings are from 0°-360°.

This flight profile curve is for TAPA Range limiting the forward NHZ to 450 m. This curve is not intended to authorize lasing from altitudes above airspace ceiling at 31,000 ft. Engagements may be represented in this chart which are not allowed due to restricted airspace limitations. Ensure airspace restrictions are adhered to by verifying with RCO for real-time airspace ceiling limitations prior to operation. This chart is a visual representation of Table 3-1. The altitudes and corresponding slant ranges above the black dotted line have a known NHZ, while altitudes and corresponding slant ranges below the black dotted line have an unknown NHZ that could extend beyond range boundaries. For additional questions, please contact 711 HPW/RHDO.

Attachment 3: Flight Profile Limitations for Aircraft-Mounted Laser Systems, TAPA Range, Estonia

Table 3-1. Flight Profile Limitation Table for Aircraft Mounted Laser Systems with Buffer Angle up to 5mrad. All targets are certified as approved to lase when aircraft is above the minimum altitude at the indicated range from any direction from which there is line of sight.

Slant Range to Target (NM)	Minimum Safe Lasing Altitude (ft above MSL)	Slant Range to Target (NM)	Minimum Safe Lasing Altitude (ft above MSL)
14	26,500	7	7,500
13	23,000	6	5,800
12	19,800	5	4,300
11	16,900	4	3,000
10	14,200	3	2,100
9	11,700	2	1,300
8	9,500	≤1	800

LD – **Laser-Dependent:** Laser NHZs extend beyond range boundary. RLSO should verify the laser used has an NOHD less than or equal to the Max NOHD as listed in the far right column of the table NO LOS – No Line of Sight between OP and Target

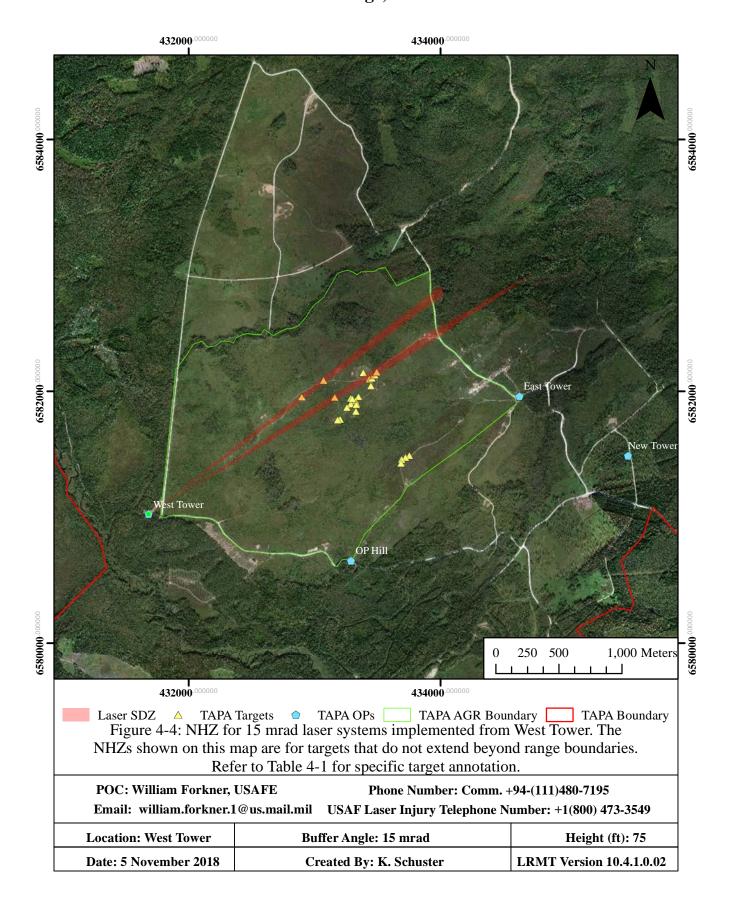

^{* -} Exceeds AGR Boundary but still remain within TAPA Training Area

Table 7-1. Rotary-Wing Targets Assessed for Laser Systems

	Table 7-1. Rotary-wing Targets Assessed for Laser Systems								
Target Number	Target Description	5 mrad	10 mrad	Max NOHD (km)					
1	Bomb Circle	YES	YES	N/A					
2	APC	NO LOS	NO LOS	NO LOS					
3A	Village-Connex A	YES	LD	3.8					
3B	Village-Connex B	YES	YES	N/A					
3C	Village-Connex C	YES	YES	N/A					
3D	Village-Connex D	YES	YES	N/A					
3E	Village-Connex T-Shape E	YES	YES	N/A					
3F	Village-Connex L-Shape F	YES	YES	N/A					
3G	Village-Connex T-Shape G	YES	YES	N/A					
3H	Village-Connex H	YES	YES	N/A					
3I	Village-Concrete Bunker I	YES	YES	N/A					
3J	Village-Concrete Bunker J	YES	YES	N/A					
3K	Village-Scrapped Vehicle K	YES	YES	N/A					
3L	Village-Scrapped Vehicle L	YES	YES	N/A					
4A	Convoy South A	YES	YES	N/A					
4B	Convoy South B	YES	YES	N/A					
4C	Convoy South C	YES	YES	N/A					
4D	Convoy South D	YES	YES	N/A					
5A	Convoy North A	YES	YES	N/A					
5B	Convoy North B	YES	YES	N/A					
5C	Convoy North C	YES	YES	N/A					
5D	Convoy North D	YES	YES	N/A					
6	Bomb Shelter	NO LOS	NO LOS	NO LOS					
7	SA-9	YES	YES	N/A					

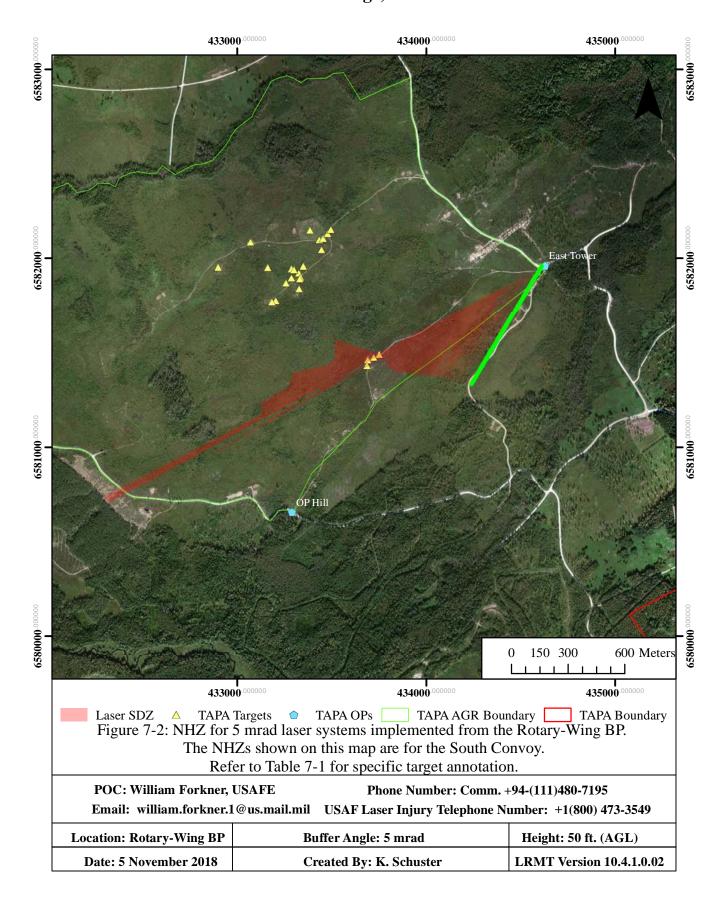

YES – NHZ is contained within range boundary

LD – **Laser-Dependent:** Laser NHZs extend beyond range boundary. RLSO should verify the laser used has an NOHD less than or equal to the Max NOHD as listed in the far right column of the table NO LOS – No Line of Sight between OP and Target
